

physical graph $G = (V, E)$

matrix-tree

computational basis

$$au_r(z) = \sum_{T \in \text{Trees}_r(G)} e^{\beta_T + \Theta_T^\top z}$$

$$\Theta_T = \sum_{e \in T} K_e$$

basis is $\{\Theta_T : T \in \text{Trees}_r(G), r \in V\}$

not the isolated edge set $\{K_e : e \in E\}$

edges carry learned vectors K_e
